

## CLAIMS

What is claimed is:

- 
- 
1. A liquid crystal display device comprising:  
a liquid crystal layer having a twist angle ( $\phi$ ) of about  $60^\circ$  to about  $90^\circ$ ;  
a polarizer positioned to receive light from a light source and to polarize said light, said polarizer polarizing said light such that an angle  $\beta$  exists between a vector of said polarized light and a first alignment direction of said liquid crystal layer;  
wherein  $\beta$  is in a range of about  $-13^\circ$  to about  $+13^\circ$  and wherein a value of  $\Delta n d$  is about  $0.1\mu\text{m}$  to about  $0.2\mu\text{m}$  where  $\Delta n$  is a birefringence of the liquid crystal layer and  $d$  is a thickness of the liquid crystal layer.
  2. A liquid crystal display device as in claim 1 further comprising:  
a first substrate coupled to said liquid crystal layer;  
a second substrate coupled to said liquid crystal layer, said first substrate and said second substrate defining said thickness  $d$ .
  3. A liquid crystal display device as in claim 2 wherein said second substrate comprises a reflective surface.
  4. A liquid crystal display device as in claim 3 wherein said reflective surface comprises a plurality of reflective pixel electrodes disposed on said second substrate.

5. A liquid crystal display device as in claim 4 wherein said second substrate comprises an integrated circuit.
6. A liquid crystal display device as in claim 2 wherein said first substrate is transparent and comprises a transparent electrode.
7. A liquid crystal display device as in claim 6 wherein a first alignment layer is created on said first substrate, said first alignment layer determining said first alignment direction and wherein a second alignment layer is created on said second substrate, said second alignment layer determining a second alignment direction and wherein said twist angle is determined by the angle between said first alignment direction and said second alignment direction.
8. A liquid crystal display device as in claim 7 wherein said polarizer is a polarizing beamsplitter.
9. A liquid crystal display device as in claim 2 wherein said light source is a field sequential light source which separately provides a plurality of different colored light over time which correspond to separate color fields.

10. A liquid crystal display device as in claim 9 wherein said light source comprises 3 differently colored LEDs (light emitting diodes) which are sequentially and separately turned on.

11. A liquid crystal display device as in claim 2 further comprising:  
at least one lens positioned to receive modulated light from said liquid  
crystallayer.

12. A liquid crystal display device as in claim 11 wherein said liquid crystal display device is housed within a head mounted display.

13. A liquid crystal display device as in claim 9 wherein each separate color field of said separate color fields lasts for no longer than about 8 milliseconds.

14. A liquid crystal display device as in claim 2 wherein said twist angle is about  $80^\circ$  and said  $\beta$  is in a range of about  $-5^\circ$  to about  $+5^\circ$  and said  $\Delta n$  is in a range of about  $0.13\mu\text{m}$  to about  $0.17\mu\text{m}$ .
